Performance Monitoring for the Cloud

Werner Keil
JSR 363 Maintenance Lead
@wernerkeil

October 18, 2017
Agenda

1. Introduction
2. Performance Co-Pilot
3. Dropwizard Metrics
4. MicroProfile Metrics
5. Prometheus
6. StatsD
7. Demo
Who am I?

Werner Keil

[www.linkedin.com/in/catmedia]

• Consultant – Coach
• Creative Cosmopolitan
• Open Source Evangelist
• Software Architect
• Spec Lead – JSR363
• Individual JCP Executive Committee Member

What is Monitoring?

Monitoring applications is observing, analyzing and manipulating the execution of these applications, which gives information about threads, CPU usage, memory usage, as well as other information like methods and classes being used.

A particular case is the monitoring of distributed applications, aka the Cloud where the performance analysis of nodes and communication between them pose additional challenges.
A high-level view of Cloud Monitoring
Challenges at System Level

• Efficient Scalability
  – Supporting tens of thousands of monitoring tasks
  – Cost effective: minimize resource usage

• Monitoring QoS
  – Multi-tenancy environment
  – Minimize resource contention between monitoring tasks

• Implication of Multi-Tenancy
  – Monitoring tasks: adding, removing
  – Resource contention between monitoring tasks
## Performance vs Number of Hosts

**60 items per host, update frequency once per minute**

<table>
<thead>
<tr>
<th>Number of hosts</th>
<th>Performance (values per second)</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>100</td>
</tr>
<tr>
<td>1000</td>
<td>1000</td>
</tr>
<tr>
<td>10000</td>
<td>10000</td>
</tr>
</tbody>
</table>

<table>
<thead>

</tr>
<tr>
<td>10000</td>
<td>100000</td>
</tr>
</tbody>
</table>
Monitoring Tips

• Regularly apply “Little’s Law” to all data... generic (queueing theory) form:
  \[ Q = \lambda R \]

• Length = Arrival Rate x Response Time
  – e.g. 10 MB = 2 MB/sec x 5 sec

• Utilization = Arrival Rate x Service Time
  – e.g. 20% = 0.2 = 100 msec/sec x 2 sec
Types of Monitoring

Monitoring Logs
- Logstash
- Redis
- Elasticsearch
- Kibana Dashboard

Monitoring Performance
- Collectd
- Statsd
- PCP
- Graphite
- Database (e.g., PSQL)
- Grafana Dashboard
Monitoring Logs – Kibana Dashboard
Monitoring Performance

How is this traditionally done?

- rsyslog/syslog-ng/journald
- top/iostat/vmstat/ps
- Mixture of scripting languages (bash/perl/python)
- Specific tools vary per platform
- Proper analysis requires more context
Performance Co-Pilot

PCP
http://www.pcp.io

GitHub
https://github.com/performancecopilot
What is PCP?

- Open source toolkit
- System-level analysis
- Live and historical
- Extensible (monitors, collectors)
- Distributed
- Unix-like component design
- Cross platform
- Ubiquitous units of measurement
PCP Basics

Agents and Daemons

At the core we have two basic components:

1. Performance Metric
   - Domain Agents
     - Agents

2. Performance Metric
   - Collection Daemon
     - PMCD
PCP Metrics

- `pminfo  --desc -tT --fetch disk.dev.read`

`disk.dev.read [per-disk read operations]`
Data Type: 32-bit unsigned int  InDom: 60.1
Semantics: counter  Units: count
Help: *Cumulative count of disk reads since boot time*
Values:

inst [0 or "sda"] value **3382299**
inst [1 or "sdb"] value **178421**
PCP Agents

Kernel

Webserver (apache/nginx)

DBMS

Network

PMCD
PCP Clients

Agents <-> PMCD

- pmie
- pmstat
- pmval
- pmchart
- pminfo
PCP Remote Clients

Agents → PMCD

PMCD → Clients → Remote PMCD
PCP Data Model

- Metrics come from one source (host / archive)
- Source can be queried at any interval by any monitor tool
- Hierarchical metric names
  e.g. disk.dev.read and aconex.response_time.avg
- Metrics are singular or set-valued ("instance domain")
- Metadata associated with every metric
  - Data type (int32, uint64, double, ...)
  - Data semantics (units, scale, ...)
  - Instance domain
Performance Timeline

• Where does the time go?
• Where’s it going now?
• Where will it go?
Performance Timeline – Toolkit

- Archives
- Live Monitoring
- Modelling and statistical prediction
Performance Timeline – PCP Toolkit

- Yesterday, last week, last month, ...
- All starts with pmlogger
  - Arbitrary metrics, intervals
  - One instance produces one PCP archive for one host
  - An archive consists of 3 files
    - Metadata, temporal index, data volume(s)
  - pmlogger_daily, pmlogger_check
  - Ensure the data keeps flowing
  - pmlogsummary, pmwtf, pmdumptext
  - pmlogextract, pmlogreduce
Custom Instrumentation (Applications)
PCP – Parfait

Parfait has 4 main parts (for now)

• Monitoring
• DXM
• Timing
• Requests
Parfait – Monitoring

• This is the ‘original’ PCP bridge metrics (heavily modified)
• Simple Java objects (MonitoredValues) which wrap a value (e.g. AtomicLong, String)
• MonitoredValues register themselves with a registry (container)
• When values changes, observers notice and output accordingly
  • PCP
  • JMX
  • Other (Custom/Extended)
• Very simple to use
• ‘Default registry’ (legacy concept)
Parfait – Timing

• Logs the resources consumed by a request (an individual user action)
• Relies on a single request being thread-bound (and threads being used exclusively)
• Basically needs a Map<Thread, Value>
• Take the value for a Thread at the start, and at the end
• Delta is the ‘cost’ of that request
Parfait – Timing Example

[2010-09-22 15:02:13,466 INFO ][ait.timing.Log4jSink][http-8080-Processor3 gedq93kl][192.168.7.132][20][] Top taskssummaryfeatures:tasks

Parfait – Requests

• As well as snapshotting requests after completion, for many metrics we can see meaningful ‘in-progress’ values
• Simple JMX bean which ‘walks’ in-progress requests
• Tie in with ThreadContext (MDC abstraction)
• Include UserID
• ThreadID
PCP – Speed

**Golang** implementation of the PCP instrumentation API

There are 3 main components in the library

- Client
- Registry
- Metric
Monitoring # Performance

PCP – Speed Metric

- SingletonMetric
  - This type defines a metric with no instance domain and only one value. It requires type, semantics and unit for construction, and optionally takes a couple of description strings.

  A simple construction

  ```go
  metric, err := speed.NewPCPSingletonMetric(
      42,            // initial value
      "simple.counter", // name
      speed.Int32Type,    // type
      speed.CounterSemantics, // semantics
      speed.OneUnit,  // unit
      "A Simple Metric", // short description
      "This is a simple counter metric to demonstrate the speed API", // long desc
  )
  ```
PCP for Containers
PCP for Containers – Cgroup Accounting

- [subsys].stat files below /sys/fs/cgroup
- individual cgroup or summed over children
- blkio
- IOPs/bytes, service/wait time – aggregate/per-dev
- Split up by read/write, sync/async
- cpuacct
- Processor use per-cgroup - aggregate/per-CPU
- memory
- mapped anon pages, page cache, writeback, swap, active/inactive LRU state
PCP for Containers – Namespaces

• Example: cat /proc/net/dev
• Contents differ inside vs outside a container

• Processes (e.g. cat) in containers run in different network, ipc, process, uts, mount namespaces

• Namespaces are inherited across fork/clone
• Processes within a container share common view
PCP Container Analysis – Goals

- Allow targeting of individual containers
- e.g. /proc/net/dev
- pminfo --fetch network
- vs
- pminfo –fetch –container=crank network
- Zero installation inside containers required
- Simplify your life (dev_t auto-mapping)
- Data reduction (proc.*, cgroup.*)
PCP Container Analysis – Mechanisms

- `pminfo -f --host=acme.com --container=crank network`
- Wire protocol extension
- Inform interested PCP collector agents
- Resolving container names, mapping names to cgroups, PID's, etc.
- `setns(2)`
- Runs on the board, plenty of work remains
- New monitor tools with container awareness
What is Metrics?

- Code instrumentation
- Meters
- Gauges
- Counters
- Histograms
- Web app instrumentation
- Web app health check
Metrics Reporters

• Reporters
  • Console
  • CSV
  •Slf4j
  • JMX

• Advanced reporters
  • Graphite
  • Ganglia
Metrics 3rd Party Libraries

- AspectJ
- InfluxDB
- StatsD
- Cassandra
- Spring
Metrics Basics

- **MetricsRegistry**
  - A collection of all the metrics for your application
  - Usually one instance per JVM
  - Use more in multi WAR deployment

- **Names**
  - Each metric has a unique name
  - Registry has helper methods for creating names

```java
MetricRegistry.name(Queue.class, "items", "total")
//com.example.queue.items.total
MetricRegistry.name(Queue.class, "size", "byte")
//com.example.queue.size.byte
```
Metrics Elements

- Gauges
  - The simplest metric type: it just returns a *value*

```java
final Map<String, String> keys = new HashMap<>();
registry.register(MetricRegistry.name("gauge", "keys"), new Gauge<Integer>() {

@Override
public Integer getValue() {
    return keys.keySet().size();
}
});
```
Metrics Elements (2)

- Counters
  - Incrementing and decrementing 64.bit integer

```java
final Counter counter = registry.counter(MetricRegistry.name("counter", "inserted"));
counter.inc();
```
Metrics Elements (3)

- **Histograms**
  - Measures the distribution of values in a stream of data

```java
final Histogram resultCounts = registry.histogram(name(ProductDAO.class, "result-counts");
resultCounts.update(results.size());
```

- **Meters**
  - Measures the rate at which a set of events occur

```java
final Meter meter = registry.meter(MetricRegistry.name("meter", "inserted");
meter.mark();
```
Metrics Elements (4)

- Timers
  - A histogram of the duration of a type of event and a meter of the rate of its occurrence

```java
Timer timer = registry.timer(MetricRegistry.name("timer", "inserted"));
Context context = timer.time();
//timed ops
context.stop();
```
final Graphite graphite = new Graphite(new InetSocketAddress("graphite.example.com", 2003));
final GraphiteReporter reporter = GraphiteReporter.forRegistry(registry)
  .prefixedWith("web1.example.com")
  .convertRatesTo(TimeUnit.SECONDS)
  .convertDurationsTo(TimeUnit.MILLISECONDS)
  .filter(MetricFilter.ALL)
  .build(graphite);
reporter.start(1, TimeUnit.MINUTES);

Metrics can be prefixed
Useful to divide environment metrics: prod, test
Metrics – Grafana Application Overview
What is Eclipse MicroProfile?

- Eclipse MicroProfile is an open-source community specification for Enterprise Java microservices.
- A community of individuals, organizations, and vendors collaborating within an open source (Eclipse) project to bring microservices to the Enterprise Java community.
Specifications 1.2

- **Health Check 1.0**
- **Metrics 1.0**
- **Config 1.1**
- **Fault Tolerance 1.0**
- **CDI 1.2**
- **JSON-P 1.0**
- **JWT Propagation 1.0**
- **JAX-RS 2.0**

**MicroProfile 1.2**

- New
- No change from last release
What is Prometheus?

Prometheus is an open-source systems monitoring and alerting toolkit originally built at SoundCloud. It is now a standalone open source project and maintained independently of any company.
Prometheus Components

- The main Prometheus server which scrapes and stores time series data
- Client libraries for instrumenting application code
- A push gateway for supporting short-lived jobs
- Special-purpose exporters (for HAProxy, StatsD, Graphite, etc.)
- An alertmanager
- Various support tools
- WhiteBox Monitoring instead of probing (aka BlackBox Monitoring)
What is StatsD?

A network daemon that runs on the Node.js platform and listens for statistics, like counters and timers, sent over UDP or TCP and sends aggregates to one or more pluggable backend services (e.g., Graphite).

StatsD was inspired (heavily) by the project (of the same name) at Flickr.
Action!
